

FOCuS

Development of a liquid biopsy test and treatment of small-cell lung cancer.

What is FOCuS about?

Small-cell lung cancer (SCLC) is a type of tumor with an extremely low survival rate. In our collaborative project FOCuS, we aim to develop a new form of immune cell therapy as well as an accompanying cancer test (liquid biopsy). The goal is that, through the combined development of the therapy and the cancer test, SCLC can be detected earlier and treated in a more targeted and effective way.

This project is funded by the European Union in the field of research and innovation.
